Carpet Estimates without the Tape Measure

May 19, 2010

As a carpet layer by trade you can spend a lot of time crawling around on your hands and knees with a tape measure. It might not sound like much fun but can you think of any other way to get the proper measurements?

If you have an iPhone or an iPod Touch the good news is you don't have to come up with another solution. You can find the answer in the iTunes App Store. On Center Software, www.oncenter.com, The Woodlands, Texas, recently released Carpet Estimator, a software application that gives users access to a floor plan generator to help estimate perimeter trim and carpet length.

With Carpet Estimator, users can choose from 10 different preset room layouts, which they can also manipulate to match their specific floor plan by dragging arrows on the screen. The app even lets contractors see how the carpet will lay in the room and enter in specific carpet and trim prices. The app will also summarize all of the data to give users the perimeter and area of the room, plus the total price.

For projects involving multiple rooms, Carpet Estimator makes it easy for

contractors to combine measurements and pricing for separate rooms into a single report, which includes a breakdown of required materials. The app also saves the data from each room in a database so users can reference and modify it for other similar projects.

According to On Center, this program was designed as a standalone app, and is not intended to integrate with On Center's suite of software.
