

Digital Production Control™

Instant Visual Work-in-Place Tracking

Digital Production Control

REDUCING JOB COST OVERRUNS

Digital Production Control™ gives you total job visibility to recognize labor production problems instantly. By integrating the takeoff and estimating processes, this powerful program digitally tracks labor production and payroll directly from the field to the project manager's work station in the office. Color-coded plans display work in progress and indicate exactly where labor cost overruns are occurring. Now the foreman can know immediately what production was expected to be achieved on each cost code and phase of the job. This dynamic tool lets you know if your project is winning or losing the budget war.

If the last 5% of the job is draining 50% of your profits, Digital Production Control is your answer!

BENEFIT FROM:

- Instant color-coded visual feedback for jobsite and office management showing if the project's production is being achieved, close, or over budget.
- Calculating the percent complete on a weighted average basis.
- Lining out production and monitoring it daily.
- Measuring actual production against the estimate.
- Using projected hours and production to identify problem floors and activities in time to turn them around.
- Sending and receiving project information via the Internet using wireless technology.
- Capturing valuable information for each specific activity to manage labor and maximize profit.
- Importing and exporting accounting information.
- Tracking and reporting real costs in real time.
- Knowing the actual achieved labor production and having the ability to improve future bidding methods.

MORE ABOUT DIGITAL PRODUCTION CONTROL

Digital Production Control is designed to work exclusively with the latest releases of On-Screen Takeoff and Quick Bid. All of these programs are Microsoft® Windows Vista™ compatible.

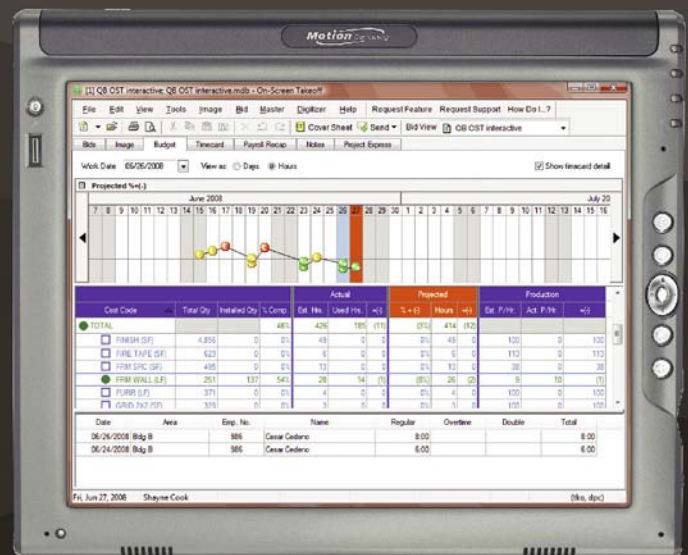

The main objective of our five-year Digital Production Control project was to accomplish one thing: Stop labor cost overruns from wiping out your profits! Digital Production Control instantly compares the estimated labor budget with actual work-in-place to produce color-coded drawings showing exactly what, where and how fast materials are being installed.

Now owners, estimators and project managers can all see real-time production as it happens. Digital Production Control uses a color-coded system that allows the user to instantly see if they are achieving, outperforming, or falling behind the estimated production rates.

This information can then quickly be sent over the Internet to the office. By automatically displaying the failing labor productions in red, Digital Production Control helps the project manager immediately identify the snag in production, and to see exactly what is happening in the field. Using this vital information, the user is able to make the necessary adjustments to prevent any overruns.

Your estimating team will have a detailed labor productivity analysis (by cost code) on every project, which is invaluable information for future bidding. Knowing outsells guessing every time!

Imagine if every job came in on budget! After all, you've had enough practice. It's time to make some money! Eliminate manually summarizing takeoff. Benefit from **conditions** itemized by area and **totaled automatically**, with filtering capabilities.
